Week 9:Identity and Access Management

Practical

1. Creating users

I planned to create two Ubuntu user accounts using the following commands:

sudo adduser user1

sudo adduser user2

2. Creating a group

I planned to create a group called security and add both users to it.

sudo groupadd security

sudo usermod -aG security user1

sudo usermod -aG security user2

3. Configuring permissions

I planned to create a shared folder and configure its permissions.

sudo mkdir /shared/security

sudo chown root:security /shared/security

sudo chmod 770 /shared/security

4. Verifying access

I planned to check the users, group membership and folder permissions.

id user1

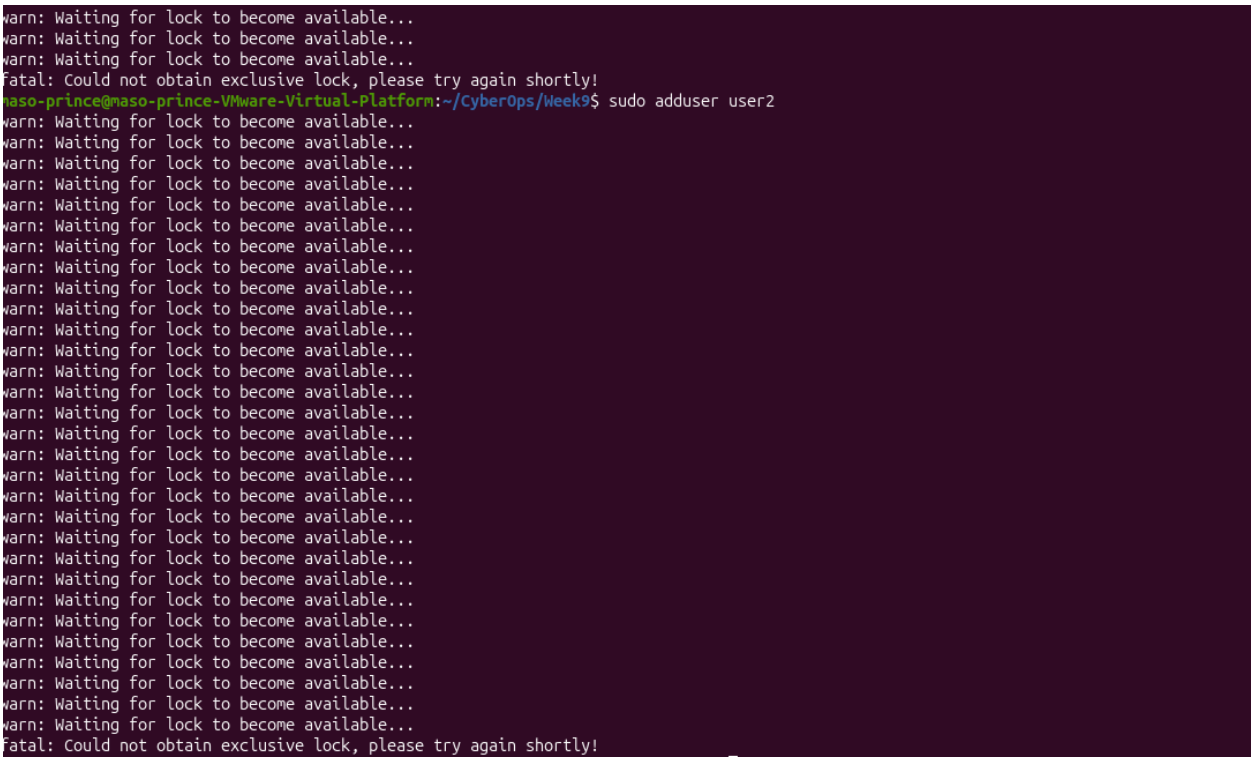

id user2

getent group security

ls -ld /shared/security

5. System issue

During the practical, Ubuntu displayed a "Could not obtain exclusive lock" error. This prevented me from continuing with the configuration. I captured a screenshot of the error as evidence.

6. SOC relevance

Identity and Access Management helps SOC analysts monitor user accounts, permissions and login activities to prevent unauthorised access.

7. Conclusion

I was unable to complete the practical because Ubuntu could not obtain the exclusive lock. However, I identified the commands needed to create users, groups and permissions using the principle of least privilege. My next step would be to resolve the issue, complete the practical and verify the access permissions.
